

## INDUSTRIAL AND TRANSMITTING VALVES

## DEFINITIONS AND INTERPRETATION OF DATA

The characteristics and curves published in this Handbook are based upon the average of readings taken on a number of valves, and the performance figures given under "Typical Operating Data" are values to be expected when average valves are used under appropriate conditions. The conditions selected are those under which the power delivered and the efficiency are as high as possible compatible with good valve life.

### **Amplification Factor**

The amplification factors quoted for pentodes and tetrodes are those of  $g_1$  with respect to  $g_2$ .

### **Drive Power**

The value given is the power actually absorbed at the grid of the driven valve. The previous stage should be capable of delivering from twice to three times this power to allow for circuit losses.

### **Input Voltage**

The value quoted is the peak value ( $v_{pk}$ ) unless otherwise stated. For push-pull stages the grid-to-grid value is given.

### **Output Power**

The value given is the total output delivered by the valve. The useful power will be somewhat less, dependent upon circuit losses.

### **Mercury Vapour Rectifiers**

The maximum peak inverse voltage figure applies up to a maximum supply frequency of 150 c/s. At 500 c/s this value must be reduced by 15% and at 800 c/s by 25%.

By "D.C. Output Voltage" is meant the mean value of the unsmoothed rectified voltage, i.e., the voltage input to the filter.

■

The following recommendations should be interpreted in conjunction with British Standard Code of Practice No. CP1005: Part 7: 1954, 'The Use of Electronic Valves', upon which these notes have, in part, been based.

#### GENERAL

The published characteristics and curves are based upon the average of readings taken on a number of valves and the operating conditions given are those which result in optimum power output and efficiency without over-running the valve. Failure to observe the various recommendations may seriously reduce the life of the valve and in some instances result in catastrophic failure.

#### LIMITING VALUES

The limiting values are absolute. It is important that none of these limits are ever exceeded and such variations as mains fluctuations, component tolerances and switching surges, must be taken into account in deciding the nominal valve operating conditions.

In some instances, such as pulse operation or intermittent service, it may be permitted to exceed the absolute values but, to ensure the validity of the guarantee, the desired operating conditions must be agreed with Mullard Limited, (Industrial Technical Service Department).

#### TYPICAL OPERATING CONDITIONS

Typical operating conditions are shown for various modes of operation, e.g. 'r.f. power amplifier class C telegraphy' or 'telephony', etc. Some of the typical operating conditions for a particular mode of operation may incorporate one or more of the absolute ratings; in such cases the designer should take precautionary steps to ensure that these ratings are never exceeded.

#### FILAMENT OR HEATER SUPPLY

Either a.c. or d.c. supply may be used for filament heating. The published negative grid bias voltages are based upon a.c. heating. When d.c. heating is employed for directly heated valves the grid bias should be reduced by one-half of the filament voltage and when the anode current is greater than 5% of the filament current the h.t. return should be taken to a centre point resistor or to a reversing switch. When a.c. is employed the h.t. return should be taken to the centre tap of the filament transformer.

Measurements of the filament or heater voltage should always be

## GENERAL OPERATIONAL RECOMMENDATIONS

## TRANSMITTING VALVES

made after the valve and supply transformer have attained their working temperature, and should be taken at the valve pins or terminals.

### (a) Oxide-coated Filaments and Cathodes

To obtain maximum life the filament or heater voltage must be within  $\pm 2.5\%$  of the nominal value and temporary fluctuations should not exceed  $\pm 10\%$ .

With valves specially designed for use in mobile transmitters, emergency operation of the filament or heater down to the specified voltage is allowed.

### (b) Thoriated Tungsten Filaments

To obtain maximum life the filament voltage must be within  $\pm 1\%$  of the nominal value and temporary fluctuations should not exceed  $\pm 5\%$ .

### (c) Pure Tungsten Filaments

It is essential, when using valves with pure tungsten filaments, that the recommended filament operating conditions are never exceeded. The filament voltage marked on such valves is that which provides the rated total emission (i.e. 90% of the saturation emission) when the valve is new. In order to maintain this emission over the whole life of the valve, the filament voltage must be increased progressively to a total maximum of 105%. When less than the rated total emission is required for a particular application, the life can be extended by operating the filament at a reduced voltage.

### (d) Filament Switching

It may be necessary with some valves to limit the filament current when switching on the supply. Information on this will generally be included on individual data sheets but in cases of doubt Mullard Limited, (Industrial Technical Service Department) should be consulted.

## COOLING

### (a) General

With radiation-cooled valves the maximum base, seal and envelope temperatures are given in the published data. To avoid exceeding these it may sometimes be necessary to provide artificial cooling.

In the development stage of an equipment the various temperatures should be measured with due regard to the ultimate environmental conditions. Special paints and lacquers are available for this purpose but any other suitable method can be used.

TRANSMITTING  
VALVES

GENERAL OPERATIONAL  
RECOMMENDATIONS

In some cases the filament and grid seals of water-cooled, forced-air-cooled and silica valves require cooling and guidance is given on individual data sheets.

Where additional cooling is necessary for safe operation precautionary steps must be taken to switch off all supply voltages in the event of failure or reduction of the cooling medium.

(b) *Water-Cooling*

A water-cooled valve should always be used with the recommended type of water jacket. The circulating cooling water should be as free as possible from all solid matter and the dissolved oxygen content should be low. Whenever possible a closed water system using distilled or demineralised water should be employed. In general, the resistivity of the cooling water should not be less than  $3.3\text{k}\Omega/\text{c.c}$  and the inorganic solid content should not exceed 3 parts in  $10^6$ , but for some applications and some types of valves it may be desirable for the resistivity to be considerably higher and the solid content to be less. If desired, Mullard Limited, (Industrial Technical Service Department) will undertake to analyse the available water supply.

The temperature limits given in the individual data sheets should in no circumstances be exceeded and it is essential to insert an automatic device in the water outlet to switch off the supply voltages in the event of the failure or reduction of the water supply.

(c) *Forced-Air Cooling*

The temperature limits laid down in the data sheets should in no circumstance be exceeded and precautions should be taken to switch off all supply voltages in the event of a fault in the air circulating system.

The use of an inlet filter in the air supply is recommended particularly in dusty or dirty locations to avoid clogging the radiator air ducts.

(d) *Auxiliary Air and Water-Cooling*

Where auxiliary cooling is specified, e.g. for grid seals, precautionary steps must be taken to switch off all supply voltages in the event of the failure or reduction of these auxiliaries.

**VALVES IN R.F. HEATING APPLICATIONS**

The service conditions associated with r.f. heating, i.e. induction heating, dielectric-loss heating and short wave diathermy, can be more severe than those associated with communication service.

## GENERAL OPERATIONAL RECOMMENDATIONS

## TRANSMITTING VALVES

These severe conditions are mainly due to the wide variations in load impedance usually encountered which, in turn, produce large variations in grid current, anode current, grid dissipation and anode dissipation. The risk of exceeding the valve ratings is, therefore, increased.

For valves recommended for r.f. heating applications, the data sheets include ratings and typical operating conditions calculated to provide margins of safety against variations of load and supply voltage. Since it is not possible to anticipate the degree of protection which a designer may wish to incorporate, these data generally give two sets of operating conditions:

- (a) for the valve fed from an unsmoothed d.c. supply and where no protection is incorporated in the equipment against valve over-load, under-drive or inefficient operation, and;
- (b) for the valve fully protected; this offers a performance only slightly less than that allowed for maximum 'class C telegraphy.'

The designer may choose an operating condition between these extremes depending upon the degree of protection which he decides to incorporate in the equipment. However, no limiting values may be exceeded during the work cycle.

It may sometimes be desired to use a valve for which no industrial ratings are given. The following table considers five methods of operation of triodes and indicates the factors by which the maximum 'class C telegraphy' should be multiplied in order to arrive at a safe rating, and designers are strongly recommended to give due consideration to these factors:

**Method 1.** Equipments fitted with effective automatic mains voltage stabilisation and effective automatic protection against valve over-load and over-drive and in which the power supply is derived from a filtered source containing not more than 5% ripple. (Three-phase full-wave and six-phase half or full-wave rectifier systems whether filtered or unfiltered, may be taken as meeting this requirement.)

**Method 2.** D.C. smoothed but unprotected.

**Method 3.** Equipment supplied by unsmoothed full-wave biphasic rectifier but not fitted with automatic regulation or over-load protection.

**Method 4.** Self-rectifying equipment half-wave operation.

**Method 5.** Self-rectifying equipment full-wave operation without smoothing choke.

TRANSMITTING  
VALVES

GENERAL OPERATIONAL  
RECOMMENDATIONS

FACTORS APPLICABLE TO EACH VALVE

Method	1	2	3	4	5
Anode voltage r.m.s.	—	—	—	0.8	0.8
Anode voltage d.c.	0.95	0.8	0.7	—	—
Anode current	0.95	0.8	0.7	0.4	0.4
Power input	0.9	0.65	0.6	0.3	0.3
Anode dissipation	0.95	0.6	0.6	0.6	0.6
Control-grid current	0.9	0.8	0.7	0.4	0.4
Control-grid dissipation	0.9	0.7	0.7	0.7	0.7

Should it be desired to use tetrodes for r.f. heating applications Mullard Limited, (Industrial Technical Service Department) should be consulted.

To avoid damage to the valve in the event of an overload it is recommended that the minimum protection incorporated in industrial heating equipment should include a rapid action device to cut off the h.t. when the anode or grid current exceeds the maximum rating. If the anode dissipation at zero grid bias exceeds the limiting value, then grid under-current protection is also recommended in case oscillation ceases while the h.t. is applied. Further, where water or forced-air cooling of the valve is used, protection against failure of the cooling system is necessary.

MOUNTING

It is strongly recommended that all valves be mounted vertically. It is, however, permissible to mount some of the smaller valves horizontally provided that, for directly heated valves, the plane of the filament is vertical or, for indirectly heated valves, the plane of the major axis of the first grid is vertical. Recommendations on mounting are given on the data sheets when necessary.

Leads having sufficient flexibility to allow for thermal expansion and other movements should be employed for the external connections to those valves whose construction is such that stress might otherwise be set up in the seals.

When designing a mounting for an r.f. valve, it is important to avoid closed circuits of conducting material in regions of strong r.f. fields, otherwise considerable loss of output may result. It is always preferable to keep the quantity of any material in the r.f. field to a minimum.

Where a valve with an internal anode (e.g. silica valve TYS5-3000) is mounted in a clamp, any large metal parts of the clamp which are located in the region of the anode should be connected to anode terminal. This will prevent heating of the glass or silica which would

## GENERAL OPERATIONAL RECOMMENDATIONS

## TRANSMITTING VALVES

otherwise result from the r.f. potential gradient between the anode and the clamp.

Clamps used for supporting silica valves should be designed in such a way as to accommodate the usual envelope tolerances and thus avoid undue pressure being applied to the envelope.

### DRIVE POWER

The value of grid current stated on the data sheets is intended only as a guide, and in making adjustments to the circuit the important factor to note is the grid driving voltage. Either over-driving or under-driving will result in a reduction in efficiency.

At low radio frequencies the drive power required for 'class C' operation can be calculated from the expression

$$P_{\text{drive}} = 0.9 \times v_{\text{in (pk)}} \times I_{g1} (\text{d.c.})$$

at higher frequencies more drive power is required due to input damping. The value given for the symbol  $P_{\text{load(driver)}}$  is the power which must be available from the driver stage to provide for valve drive, input damping and circuit losses. It may be necessary to allow more for a circuit designed for a wide tuning range.

### POWER OUTPUT

The valve output figures ( $P_{\text{out}}$ ), represent the power which the valve will deliver to the circuit and load; a figure of load power ( $P_{\text{load}}$ ) allowing for a typical circuit transfer efficiency for the type of service under consideration is stated.

When it is desired to operate power valves at frequencies so high that the efficiency is falling the input must be reduced.

### REDUCED OPERATING LEVELS

- (a) When it is desired to operate valves at reduced power levels at h.f. the valve conversion efficiency can be kept at the maximum by decreasing the input current rather than the voltage.
- (b) When operating above about 100Mc/s however, circuit losses are higher and it is preferable to keep the input current high and reduce the voltage, thus minimising the circuit loss and obtaining a better load power.
- (c) When the frequency of operation is so high that the efficiency is decreased the input power must be reduced in order to avoid excessive electrode dissipations. This should be achieved by reducing the anode voltage, see frequency/voltage characteristic in the individual data sheets.

**POWER DISSIPATED IN VALVE ELECTRODES**

Dissipation in the screen-grid is given by the product of d.c. voltage and current

$$P_{g2} = V_{g2} \times I_{g2}$$

Power in the control-grid for 'class C' operation at low radio frequencies can be closely approximated from the peak positive value of drive voltage and the d.c. grid current. (The peak positive voltage is the drive voltage less the magnitude of the bias voltage.)

$$P_{g1} = I_{g1} [0.9 V_{in(pk)} - |V_{g1}|]$$

At higher radio frequencies the grid dissipation will be somewhat higher due to the increased capacitive current in the electrode.

In many radiation-cooled types the anode becomes visibly hot when near full dissipation and the temperature can be measured by a pyrometer. The temperature for full rated dissipation is usually given in the data sheets but any other loading may be checked by making comparative measurements with d.c. power, under non-oscillatory conditions.

For valves whose anodes are cooled by circulated water or by forced-air, the anode dissipation can be assessed by measuring the rise of temperature and flow of the cooling medium.

Radiation-cooled valves which do not colour may be assessed by covering with an insulating hood, vented to produce a reasonable equilibrium temperature and provided with some form of thermometer. The measured temperature under normal operating conditions may then be checked by making comparative measurements with d.c. power, under non-oscillatory conditions.

**CLASS 'B' LOW FREQUENCY APPLICATIONS**

The performance shown on the data sheets is based on an ideal circuit with no transformer losses, a resistive load, constant supply voltages and a sinusoidal input voltage. Allowances should be made for these factors in assessing the actual useful output power.

To reduce distortion due to the flow of grid current the impedance of the circuit supplying the input to the valve must be low. The use of a cathode follower driver stage is recommended, but an input transformer with a low output impedance or with a low damping resistance may be used.

The type of driver valve chosen must be able to deliver sufficient power to overcome the circuit losses in addition to providing the actual valve drive power.

## GENERAL OPERATIONAL RECOMMENDATIONS

## TRANSMITTING VALVES

### STORAGE AND INSTALLATION

#### (a) Mounting

All large valves should be mounted with the filament vertical. The recommendation contained in individual data sheets as to the accuracy of the mounting should be complied with, otherwise the filament may sag towards the grid under its own weight. In mobile or portable equipment, and in fixed installations subject to vibration, care should be exercised to ensure that the valve supports or chassis are suitably designed to protect the valve from mechanical shock and vibration.

#### (b) Corona Effects

Metal parts (particularly sharp points or edges), which might cause intense electrostatic fields, should not be located in the vicinity of valves operating at high voltages, since corona discharge may occur and cause damage to the valve. On installation, filament and other flexible leads should be kept well clear of the bulb and adjacent conductors.

#### (c) Storage and Transit

Valves not installed in equipment should be stored in their original packing or in racks. Any rack employed should be designed to protect the valve from excessive shaking or vibration and be so constructed that no stresses are imposed on the seals or the envelope.

Normal good storage conditions should be provided to prevent deterioration, such as corrosion of contacts or impairment of electrical insulation.

Valves should always be transported in the original packing designed for the purpose.

### CONDITIONING

After transit or a period of storage it is recommended that power valves should be operated for not less than 15 minutes with the filaments only energised before being put into full service. In addition, with valves having anode voltages in excess of 5kV, the anode voltage and input power should be increased gradually or in several steps for a further period of 15 minutes, or longer, until normal operation is achieved. This treatment will clean-up traces of gases which may be present and which could cause premature failure of the valve.

Where valves are being held in store for an indefinite period it is recommended that periodic conditioning and testing is carried out as a safeguard against deterioration of vacuum. The interval of testing will, of course, depend upon the size and type of valve, and users are invited to contact Mullard Limited, (Industrial Technical Service Department) for details of treatment of individual valves.

## LIST OF SYMBOLS

These symbols are based on British Standard Specification No. 1409 : 1950.  
"Letter Symbols for Electronic Valves".

### 1. SYMBOLS FOR ELECTRODES

Anode ... ... ... a	Fluorescent Screen or Target ... t
Cathode ... ... ... k	External Metallisation ... M
Grid ... ... ... g	Internal Metallisation ... m
Heater ... ... ... h	Deflector Electrodes ... x or y
Filament ... ... ... f	Internal Shield ... s
Beam Plates ... ... ... bp	Resonator ... Res ←

NOTE 1. In valves having more than one grid, the grids are distinguished by numbers—g<sub>1</sub>, g<sub>2</sub>, etc., g<sub>1</sub> being the grid nearest the cathode.

NOTE 2. In multiple valves, electrodes of the different sections may be distinguished by adding one of the following letters:

Diode ... ... ... d	Hexode ... ... }
Triode ... ... ... t	Heptode ... ... }
Tetrode ... ... ... q	Octode ... ... }
Pentode ... ... ... p	Rectifier ... r
Thus, the grid of the triode section of a triode-hexode is denoted by g <sub>1</sub> .	

NOTE 3. Two or more similar electrodes which cannot be distinguished by any of the above means may be denoted by adding one or more primes to indicate to which electrode system the electrode forms a part.

Thus, the anode of the first diode in a double diode valve is denoted a'.

### 2. SYMBOLS FOR ELECTRIC MAGNITUDES

#### Voltages

Direct Voltage ... ... V	Direct Current ... ... I
Alternating Voltage (r.m.s.) V <sub>r.m.s.</sub>	Alternating Current (r.m.s.) I <sub>r.m.s.</sub>
Alternating Voltage (mean) V <sub>av</sub>	Alternating Current (mean) I <sub>av</sub>
Alternating Voltage (peak) V <sub>pk</sub>	Alternating Current (peak) I <sub>pk</sub>
Peak Inversa Voltage ... P.I.V.	No Signal Current ... I <sub>o</sub>

#### Miscellaneous

Frequency ... ... f	Anode Efficiency ... ... η
Amplification Factor ... μ	Sensitivity ... ... S
Mutual Conductance ... g <sub>m</sub>	Brightness ... ... B
Conversion Conductance ... g <sub>c</sub>	Temperature ... ... T
Distortion ... ... D	Time ... ... t

## LIST OF SYMBOLS

---

			Inside Valve	Outside Valve
Resistance	...	...	$r$	$R$
Reactance	...	...	$x$	$X$
Impedance	...	...	$z$	$Z$
Admittance	...	...	$y$	$Y$
Mutual Inductance	...	...	$m$	$M$
Capacitance	...	...	$c$	$C$
Capacitance at Working Temperature	...	...	$c_w$	
Power	...	...	$p$	$P$

### 3. AUXILIARY SYMBOLS

Battery or other source of supply	...	...	...	$b$
Inverse (Voltage or Current)	...	...	...	$inv$
Ignition (Voltage)	...	...	...	$ign$
Extinction (Voltage)	...	...	...	$ext$
No Signal	...	...	...	$o$
Input	...	...	...	$in$
Output	...	...	...	$out$
Total	...	...	...	$tot$
Centre Tap	...	...	...	$ct$

### 4. COMPLEX SYMBOLS

Symbols in Sections 1 and 3 above may be used as subscripts to symbols in Section 2, to denote such magnitudes as Anode Current, Grid Volts, etc., e.g.:-

Anode Voltage	...	$V_a$	Anode Current (A.C. r.m.s.)	$I_{a,r.m.s.}$
Control-Grid Voltage	...	$V_{g1}$	No Signal Anode Current	$I_{a(o)}$
Anode Supply Voltage	...	$V_{a(b)}$	Control-Grid Current	$I_{g1}$
Filament Voltage	...	$V_f$	Total Distortion	$D_{tot}$
Heater Voltage	...	$V_h$	3rd Harmonic Distortion	$D_3$
Anode Dissipation	...	$p_a$	Equivalent Noise	
Output Power	...	$P_{out}$	Resistance	$R_{eq}$
Drive Power	...	$P_{drive}$	Limiting Resistor	$R_{lim}$
Anode Current (D.C.)	...	$I_a$	Cathode Bias Resistor	$R_k$
			Internal	External
Anode Resistance	...	...	$r_a$	$R_a$
Insulation Resistance (heater to cathode)	...	...	$r_{h-k}$	
Resistance between Control-Grid and Cathode	...	...	$r_{g1-k}$	$R_{g1-k}$
Capacitance (cold) —				
Anode to all other electrodes	...	...	$C_{a-all}$	
Anode to control-grid	...	...	$C_{a-g1}$	
Control-grid to cathode at working temperature	...	...	$C_{g1-k(w)}$	
Control-grid to all other electrodes except anode (Input Capacitance)	...	...	$C_{in}$	
Anode to all other electrodes except control-grid (Output Capacitance)	...	...	$C_{out}$	
Inner Amplification Factor	...	...	$\mu_{g1-g2}$

## WATER-COOLED R.F. TRIODE

*High-power water-cooled triode, intended for  
R.F. heating applications.*

### R.F. HEATING APPLICATIONS

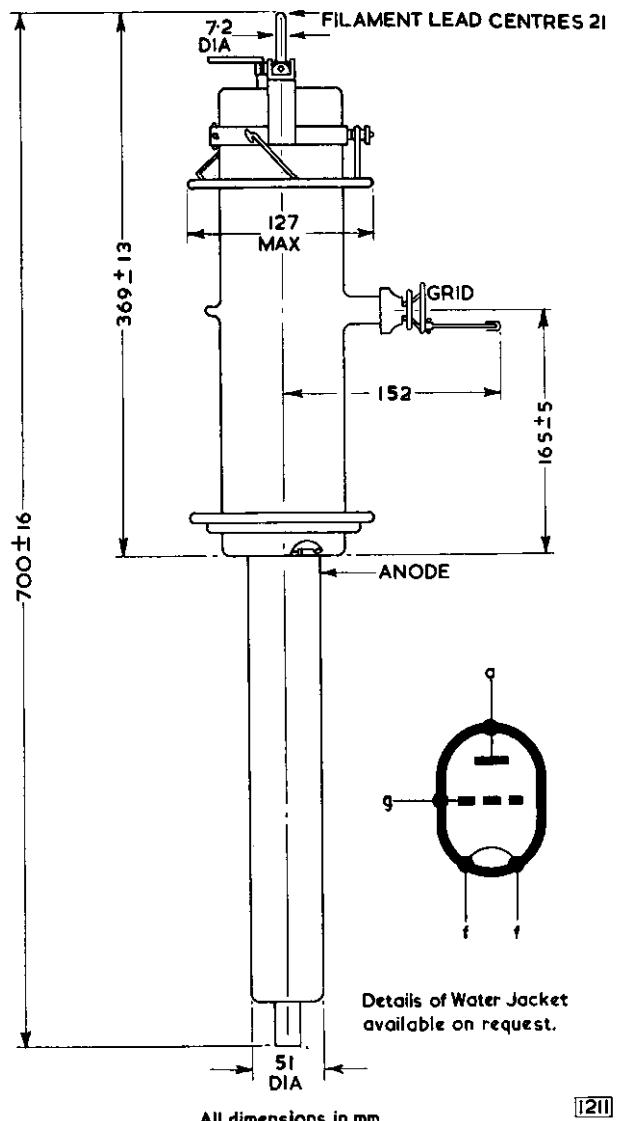

For these applications, individual requirements should be discussed with Industrial Technical Service Department, Mullard Limited.

### OPERATING NOTES

- (a) It is essential that the filament seal be cooled with a blast of air. All cooling supplies should commence before the application of any voltage.
- (b) The resistance of the filament when cold is  $0.021 \Omega$ . The filament current must never be allowed to exceed 105 amps. If the valve is operated for periods greater than 15 minutes without the applied anode voltage, the filament voltage must be reduced to one half its normal value during the stand-by period.

## V.H.F. POWER TRIODE

All-glass triode rated for a maximum anode dissipation of 135 W and suitable for use at frequencies up to 200 Mc/s.

# TY2-125

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - TRANSMITTING VALVES preceding this section of the handbook.

### FILAMENT Thoriated tungsten

$V_f$	6.3	V
$I_f$	5.4	A

### MOUNTING POSITION Vertical only, base up or down.

### CAPACITANCES

$C_{a-g}$	5.5	pF
$C_{g-f}$	5.5	pF
$C_{a-f}$	0.1	pF

### CHARACTERISTICS (Measured at $V_a=2.5$ kV; $I_a=44$ mA)

$\frac{g_m}{\mu}$	2.8	mA/V
25		

### COOLING

$T_{pins}$ max.	180	°C
Tanode seal max.	220	°C

When the valve is operated at near maximum ratings it is possible that the maximum temperature limits may be exceeded, in which case an air flow of up to 5 cu. ft. (150 litres) per minute must be directed towards the centre of the valve base.

An anode terminal connector having a large area is necessary in order to keep the anode seal cool.

### OPERATING CONDITIONS AS SINGLE VALVE R.F. POWER AMPLIFIER (CLASS "B" TELEPHONY)

#### Limiting Values

$V_a$ max.	2.5	kV
$P_a$ max. (corresponding to an anode temperature of 850°C i.e. red heat)	135	W
$P_g$ max.	16	W
$I_k$ max.	250	mA
$I_{k(pk)}$ max.	1.6	A
$R_{g-t}$ max. (fixed bias)	100	kΩ
$R_{g-t}$ max. (automatic bias)	200	kΩ

# TY2-125

## V.H.F. POWER TRIODE

All-glass triode rated for a maximum anode dissipation of 135W and suitable for use at frequencies up to 200 Mc/s.

### Typical Operating Conditions

$f$	$\leq 150$	$\leq 150$	$\leq 150$	$\leq 200$	Mc/s

### PRELIMINARY DATA

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - TRANSMITTING VALVES included in this volume of the handbook.

FILAMENT	Thoriated tungsten		
$V_f$		10	V
$I_f$		10	A

### MOUNTING POSITION

Vertical - with filament connectors up or down.  
Horizontal - with plane of electrodes vertical.

### CAPACITANCES

$C_{a-g}$	6.3	pF
$C_{g-f}$	12.3	pF
$C_{a-f}$	8.5	pF

### CHARACTERISTICS (measured at $I_a = 200mA$ )

$g_m$	4.0	mA/V
$\mu$	35	

### COOLING

$T_{anode seal max.}$	145	°C
-----------------------	-----	----

It is necessary to keep the temperature of the dome between the anode and grid seals below 145°C and under some conditions of operation an air flow of up to 40 cu.ft./min. from a 2-in. diameter nozzle directed at this area may be necessary.

### OPERATION AS SINGLE VALVE R.F. POWER OSCILLATOR OR AMPLIFIER (CLASS 'C' TELEGRAPHY OR F.M. TELEPHONY)

$P_{out}$	-	1.55	-	1.14 kW
$P_{in}$	2×350	2×1080	2×180	2×870 2×225
$V_{g-g}$	0	485	0	750 0
$I_a$	2×88	2×270	2×60	2×290 2×90
$I_g$	-	2×30	-	2×60 -
$P_a$	2×350	2×305	2×180	2×190 2×225
$P_{drive}$	-	2×7	-	2×13 -
$\eta_a$	-	71.7	-	78 -
$d_{tot}$	-	<2.5	-	<2.5 -

### RATINGS (ABSOLUTE MAXIMUM SYSTEM)

	Class 'C' Telegraphy or F. M. Telephony	Industrial Heating	Class 'B' A. F.
--	---	-----------------------	--------------------

(Unsmoothed supply)

$f_{max.}$	100	100	-	MHz
$V_a$ max.	4.0	3.8*	2.7**	kV
$-V_g$ max.	500	500	500	V
$I_g$ max.	90	90	90	mA
$I_k$ max.	500	450	500	mA
$P_a$ max.	350	350	350	W
$R_{g-f}$	100	100	100	kΩ
$P_g$ max.	40	40	40	W

\*at  $f = 50\text{MHz}$ ,    \*\*at  $f = 100\text{MHz}$

### CATHODE

Directly heated, thoriated tungsten

$V_f$	5.0	V
$I_f$	14.1	A

**CAPACITANCE**

<sup>c</sup> <sub>a-g</sub>	5.0	pF
<sup>c</sup> <sub>g-f</sub>	6.3	pF
<sup>c</sup> <sub>a-f</sub>	0.16	pF

CHARACTERISTICS (Measured at  $V_a = 3.0\text{kV}$ ,  $I_a = 90\text{mA}$ ).

$g_m$	5.0	mA/V
$\mu$	25	

**MOUNTING POSITION**

Vertical, with base up or down

**COOLING****Temperatures**

Bulb	max.	350	°C
Anode seal	max.	220	°C
Base pin seals	max.	180	°C

Below 30MHz radiation and convection cooling may be sufficient but an anode terminal connector of large volume and surface area is necessary in order to keep the anode seal cool.

Above 30MHz or with high ambient temperatures it may be necessary to direct a flow of cool air to the anode seal and base of the valve using the accessories outlined below:-

**ACCESSORIES**

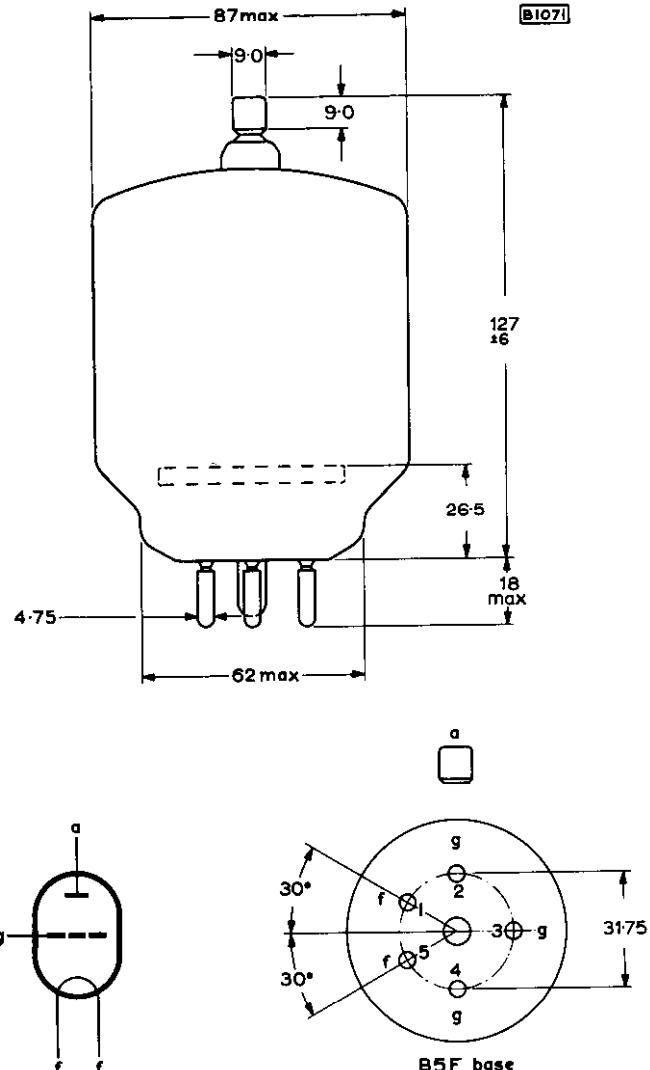

Air system socket	40211/01
Anode connector clip	40624
Air system chimney	40666

**PHYSICAL DATA**

Weight of valve	190	g

### QUICK REFERENCE DATA

*Radiation cooled triode intended for use as r.f. amplifier or oscillator or a.f. amplifier.*

	Class 'C' telegraphy	Class 'C' industrial oscillator	Class 'B' A.F.
f max.	120	100	— Mc/s
V <sub>a</sub> max.	4.0	4.0	4.0 kV
p <sub>a</sub> max.	450	450	450 W
Performance			
f	100	100	— Mc/s
P <sub>out</sub>	1.69	1.14	2.44 kW

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS—TRANSMITTING VALVES which precede this section of the handbook.

#### FILAMENT Thoriated tungsten

V <sub>f</sub>	10	V
I <sub>f</sub>	9.9	A

#### MOUNTING POSITION

Vertical only, base up or down

#### CAPACITANCES

C <sub>a-g</sub>	7.0	pF
C <sub>g-f</sub>	8.0	pF
C <sub>a-f</sub>	170	mpF

#### CHARACTERISTICS

g <sub>m</sub> (I <sub>a</sub> =125mA)	4.5 mA/V
μ	28

#### COOLING

Max. temperature of base pins	180	°C
Max. temperature of anode seal	220	°C

In order to keep within the temperature limits it may be necessary to direct a low velocity flow of air on to the anode seal and the base of the valve when operated at maximum ratings at frequencies above 50Mc/s. The air stream on to the base should be directed so that it also passes over the envelope. Below 50Mc/s, radiation cooling from the envelope is sufficient but an anode terminal connector of large surface area is necessary in order to keep the anode seal cool.

All dimensions in mm

# TY5-500

TRIODE

CONSTANT CURRENT CURVES

**TRIODE**

*Application: V.H.F. power amplifier  
Power output: 17kW continuous rating  
Frequency: 110Mc/s at full ratings, 220Mc/s at reduced ratings  
Construction: External anode, forced-air cooled*

**TY6-I2A****PRELIMINARY DATA**

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS—TRANSMITTING VALVES which precede this section of the handbook.

**FILAMENT** Directly heated, thoriated tungsten

$V_f$	6.3	V
* $I_f$	154	A
$r_f$ (cold)	0.0054	$\Omega$

\*The filament current must never exceed a surge value of 500A at any time during the warming-up period.

**MOUNTING POSITION**

Vertical only, base up or down

**CAPACITANCES**

$C_{a-g}$	29	pF
$C_{g-f}$	65	pF
$C_{a-f}$	600	mpF

**CHARACTERISTICS**

$V_a$	4.0	kV
$I_a$	1.0	A
$g_m$	60	mA/V
$\mu$	60	

**COOLING**

Forced air

Maximum temperature of anode and grid seals 180 °C

In order to keep below the specified temperature limit, it may be necessary to direct an air flow on the seals as indicated on page D5. At 220Mc/s, for example, an air flow of 21ft.<sup>3</sup> (0.6m<sup>3</sup>) per minute should be directed on each seal.

The amount of forced-air cooling required for this valve depends upon the anode dissipation and the height above sea level.

# TY6-12A

## TRIODE

Typical values of inlet temperature, rate of air flow and pressure difference between the inlet and outlet of the housing are given in the following table:—

Anode dissipation (kW)	Height above sea-level (km)	Max. inlet temperature (°C)	Min. rate of air flow (per min.) (m³) (ft³)	Pressure difference between inlet and outlet (mm of water)
5.5	0	35	5.0 177	16
5.5	1.5	4900	5.9 208	16
5.5	3.0	9800	5.7 201	16
8.0	0	35	7.7 272	35
8.0	1.5	4900	9.0 318	40
8.0	3.0	9800	9.0 318	36
10	0	35	11 388	65
10	1.5	4900	13 459	75
10	3.0	9800	13 459	66

## R.F. POWER TRIODE

Application: R.F. industrial oscillator  
Power output: 4.1kW continuous rating  
Frequency: 50Mc/s at full ratings  
Construction: External anode, forced-air cooled

# TY6-1250A

### PRELIMINARY DATA

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS—TRANSMITTING VALVES which precede this section of the handbook.

#### FILAMENT Directly heated, thoriated tungsten

*V <sub>f</sub>	6.3	V
I <sub>f</sub>	65	A

\*The filament has been designed to accept temporary voltage fluctuations of up to +5% or -10%

#### MOUNTING POSITION

Vertical only, anode up or down

#### CAPACITANCES

C <sub>a-g</sub>	7.2	pF
C <sub>g-f</sub>	13	pF
C <sub>a-f</sub>	<500	mpF

#### CHARACTERISTICS (measured at V<sub>a</sub>=6kV, I<sub>a</sub>=240mA)

g <sub>m</sub>	7.0	mA/V
μ	23	

#### COOLING

Forced air		
T <sub>seals</sub> max.	200	°C
T <sub>anode</sub> max.	270	°C

An airflow should be directed to anode and seals in order to keep the temperature below the specified limits.

At sea level and at a temperature of 35°C an airflow of 70ft<sup>3</sup>(2m<sup>3</sup>) per minute is sufficient for cooling the anode in continuous operation at maximum anode dissipation.

At higher altitudes and/or higher inlet temperatures a correspondingly greater amount of air should be applied.

The filament and grid seals require an airflow of 11ft<sup>3</sup>(0.3m<sup>3</sup>) per minute.

The airflow should be directed on the valve as indicated in Fig. 1. To keep the anode seal, opposite the nozzle, below the maximum temperature a deflection plate as indicated in Fig. 1 should be used. This should be made of a suitable insulating material such as p.t.f.e. This deflection plate can be clipped on the anode or mounted on the valve socket or on the chassis.

### QUICK REFERENCE DATA

External anode triode, intended for use as v.h.f. amplifier or oscillator or a.f. amplifier.  
 The TY6-5000A is forced-air cooled.  
 The TY6-5000W is water cooled by means of a water jacket.  
 The TY6-5000H is water cooled by means of an integral helical water cooler.

## V.H.F. POWER TRIODE

**TY6-5000A  
TY6-5000W  
TY6-5000H**

### CATHODE

Directly heated, thoriated tungsten

*V <sub>f</sub>	12.6	V
I <sub>f</sub>	33	A

\*The filament has been designed to accept temporary fluctuations of supply voltage of +5 to -10%.

The connection f<sub>ct</sub> is intended for use as the cathode current return. It is not an electrical centre tap and must not be used for filament current supply. At frequencies above 30Mc/s all three filament pins should be interconnected with suitable capacitors.

### CAPACITANCES

c <sub>a-g</sub>	11	pF
c <sub>out</sub>	300	mpF
c <sub>in</sub>	16	pF

**CHARACTERISTICS** (measured at V<sub>a</sub> = 4.0kV, I<sub>a</sub> = 1.0A)

g <sub>m</sub>	17	mA/V
μ	32	

### MOUNTING POSITION

Vertical, with base up or down

### COOLING

#### TY6-5000A

Forced-air cooled

Maximum temperatures

Anode and grid seals	180	°C
Pin seals	210	°C

In order to keep within the temperature limits it may be necessary to direct a flow of air on to the seals.

The amount of forced-air cooling required for this valve depends upon the anode dissipation and height above sea level.

Typical values of inlet temperature, rate of flow of air and pressure difference between the inlet and outlet of the housing are given in the following table:

Anode dissipation (kW)	Height above sea level (km)	Inlet temperature (°C)	Rate of flow of air per minute (m³) (ft³)	Pressure difference between inlet and outlet (mm H₂O)
1.0	0	0	3.0 105	8.0
1.0	0	0	3.1 110	8.0
1.0	1.5	4920	3.7 130	9.0
1.0	3.0	9840	4.1 145	10
3.0	0	0	5.2 185	23
3.0	0	0	6.1 215	29
3.0	1.5	4920	6.2 220	26
3.0	3.0	9840	6.6 235	26
5.0	0	0	9.2 325	68
5.0	0	0	10.7 380	90
5.0	1.5	4920	11.2 395	81
5.0	3.0	9840	11.6 410	79

TY6-5000W

Water cooled anode, low velocity air flow on seals.

Maximum temperatures

Anode and grid seals	180	°C
Water inlet	50	°C

Typical values of inlet temperature, rate of flow of water and pressure difference between the inlet and outlet housing at various anode dissipations are given in the following table:

Anode dissipation (kW)	Inlet temperature (°C)	Rate of flow of water per minute (litres) (gal)	Pressure difference between inlet and outlet (atm)
1.0	20	2.5 0.55	0.08
1.0	50	3.0 0.66	0.1
2.0	20	2.5 0.55	0.08
2.0	50	5.0 1.10	0.3
4.0	20	4.0 0.88	0.18
4.0	50	9.0 1.98	0.9
6.0	20	6.0 1.32	0.4
6.0	50	14 3.08	2.5

At inlet temperatures between 20 and 50°C the required quantity of water can be found by linear interpolation. In order to keep within the temperature limits it is necessary to direct a flow of air on to the seals at frequencies above 30Mc/s. The air flow should be started at the application of filament voltage.

## V.H.F. POWER TRIODE

**TY6-5000A  
TY6-5000W  
TY6-5000H**

)  
TY6-5000H

Water cooled anode, low velocity air flow on seals

Maximum temperatures

Water inlet	50	°C
Filament seals	210	°C
Anode and grid seals	180	°C

The amount of water cooling required for this valve depends on the anode dissipation and the temperature of the water.

Typical values of rate of flow of water through helix and pressure loss in the helix are given in the curve on page C2. The minimum rate of flow of water through helix required can be found from the curves on page C3. At frequencies above 30Mc/s and at ambient temperatures above 35°C both grid and filament seals should be cooled by a low velocity air flow.

\*(sync) level

( )

#### CATHODE

Directly heated, thoriated tungsten

$V_f$	12.6	A
$I_f$	33	A

The connection  $f_t$  is intended for use as the cathode current return and is not an electrical centre tap and must not be used for filament current supply. At frequencies above 30Mc/s all three filament leads should be interconnected with suitable capacitors.

#### CAPACITANCES

$c_{a-g}$	11	pF
$c_{in}$	16	pF
$c_{out}$	300	mpF

CHARACTERISTICS (measured at  $V_a = 4.0kV$ ,  $I_a = 1.0A$ )

$g_m$	17	mA/V
$\mu$	32	

#### MOUNTING POSITION

Vertical, base up or down.

COOLING Forced-air cooled

Maximum temperatures

$T_{anode \ seals}$	180	°C
$T_{grid \ seals}$	180	°C
$T_{pin \ seals}$	220	°C

In order to keep within the temperature limits it may be necessary to direct a flow of air on to the seals.

The amount of forced air cooling required for this valve depends upon the anode dissipation and the height above sea-level.

Typical values of inlet temperature, rate of flow of air and pressure difference between the inlet and outlet of the housing are given in the following table.

## QUICK REFERENCE DATA

External anode triode, intended for use as v.h.f. amplifier or oscillator or a.f. amplifier.

The TY7-6000A is forced air cooled.

The TY7-6000W is water cooled by means of a water jacket.

The TY7-6000H is water cooled by means of an integral helical water cooler.

## CATHODE

Directly heated, thoriated tungsten

$V_f$	12.6	V
$I_f$	33	A

\*The filament has been designed to accept temporary fluctuations of supply voltage of -5 and +10%.

The connection  $f_{ct}$  is not an electrical centre tap and must not be used for filament current supply. At frequencies above 30MHz all three filament pins should be interconnected with suitable capacitors.

## CAPACITANCE

$c_{a-g}$	11	pF
$c_{g-f}$	16	pF
$c_{a-f}$	300	mpF

## CHARACTERISTICS (measured at $V_a = 6.0kV$ , $I_a = 1.0A$ )

$g_m$	15	mA/V
$\mu$	32	

## MOUNTING POSITION

Vertical, with anode up or down.

## COOLING

The valve must not be operated without a heat dissipating connector on pin  $f_{ct}$ .

TY7-6000A Forced-air cooled

Temperatures

Filament seals	210	$^{\circ}\text{C}$
Anode and grid seals	180	$^{\circ}\text{C}$

In order to keep within the temperature limits it may be necessary to direct a flow of air on to the filament and grid seals.

## V.H.F. POWER TRIODE

TY7-6000A

TY7-6000W

TY7-6000H

The amount of forced-air cooling required for this valve depends upon the anode dissipation and the height above sea level.

Typical values of inlet temperature, rate of flow of air and pressure difference between the inlet and outlet of the housing are given in the following table:-

Anode dissipation $P_a$ (kW)	Height above sea level h (m) (ft)		Max. inlet temperature $T_{in}$ (°C)	Min. rate of flow of air per minute ( $m^3$ ) ( $ft^3$ )	Pressure difference between inlet and outlet (mmH <sub>2</sub> O) (in H <sub>2</sub> O)	
2.0	0	0	35	4.8	169	20 0.79
2.0	0	0	45	5.7	201	25 0.98
2.0	1500	4921	35	5.7	201	23 0.90
2.0	3000	9842	25	6.1	215	23 0.90
3.5	0	0	35	6.2	219	32 1.26
3.5	0	0	45	7.3	258	42 1.65
3.5	1500	4921	35	7.3	258	36 1.42

6.0	0	0	35	9.2	325	68 2.68
6.0	0	0	45	10.7	378	91 3.58
6.0	1500	4921	35	11.2	396	81 3.19
6.0	3000	9842	25	11.7	413	80 3.15

TY7-6000W Water cooled anode and low velocity air flow on seals.

Temperatures

Filament seals	210	°C
Anode and grid seals	180	°C

Typical values of inlet temperature, rate of flow of water and pressure difference between the inlet and outlet housing at various anode dissipations are given in the following table:-

Anode dissipation	Inlet temperature	Rate of flow of water per minute		Pressure difference between inlet and outlet
p <sub>a</sub> (kW)	T <sub>in</sub> (°C)	(litres)	(gal)	(atmospheres)
1.0	20	2.5	0.55	0.08
1.0	50	3.0	0.66	0.1
2.0	20	2.5	0.55	0.08
2.0	50	5.0	1.10	0.3
4.0	20	4.0	0.88	0.18
4.0	50	9.0	1.98	0.9
6.0	20	6.0	1.32	0.4
6.0	50	14	3.08	2.5

In order to keep within the temperature limits it may be necessary to direct a flow of air on to the seals. Air cooling will in general not be necessary at frequencies  $\leq 30\text{MHz}$  and a maximum ambient temperature of  $35^{\circ}\text{C}$ . At frequencies between 30 and 50MHz or at higher ambient temperatures, a low velocity air flow to the grid and filament seals will be necessary.

## V.H.F. POWER TRIODE

TY7-6000A

TY7-6000W

TY7-6000H

TY7-6000H Water cooled anode and low velocity air flow on seals.

### Temperatures

Filament seals	210	°C
Anode and grid seals	180	°C
Water inlet	50	°C

The amount of water cooling required for this valve depends on the anode dissipation and the temperature of the water.

Typical values of rate of flow of water through helix and pressure loss in the helix are given in the curve on page C2. The minimum rate of flow of water through helix required can be found from the curves on page C3.

At frequencies above 30MHz and at ambient temperatures above 35°C both grid and filament seals should be cooled by a low velocity air flow.

*Construction:* External anode, forced air cooled.

# TY8-15A

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS—TRANSMITTING VALVES, which precede this section of the handbook.

### FILAMENT Directly heated, thoriated tungsten

$V_f$  6.3 V  
\* $I_f$  130 A

\*The filament current must never exceed a surge value of 280A at any time during the warming-up period. The filament has been designed to accept temporary fluctuations of +5% to -10%.

### MOUNTING POSITION

Vertical, anode down

### CAPACITANCES

$C_{a-g}$	33.5	pF
$C_{g-f}$	44.5	pF
$C_{a-f}$	1.2	pF

### CHARACTERISTICS (measured at $V_a = 6kV$ , $I_a = 2.5A$ )

$g_m$	23	mA/V
$g_m$ (at $V_a = 500V$ , $I_a = 14A$ )	28	mA/V
$\mu$	17.5	

### COOLING

Forced air

Max. temperature of seals 220 °C

The amount of forced air cooling required for this valve depends upon the anode dissipation and the height above sea level. Typical values of inlet temperature, rate of air flow and pressure difference between the inlet and outlet of the housing are given in the following table:

Anode dissipation $P_a$ (kW)	Height above sea-level $h$ (km) (ft)	Inlet Temperature $T_{in}$ (°C)	Min. rate of flow of air per minute (m³) (ft³)	Pressure difference between inlet and outlet (mm of $H_2O$ )

### PRELIMINARY DATA

### QUICK REFERENCE DATA

Water-cooled triode, with fixed helix heat exchanger for r.f. industrial heating-applications.

f max.	30	Mc/s
V <sub>a</sub> max.	8.0	kV
p <sub>a</sub> max.	15	kW
Performance		
f	30	Mc/s
P <sub>out</sub>	17.7	kW

This data should be read in conjunction with GENERAL OPERATING RECOMMENDATIONS - TRANSMITTING VALVES.

### INDUSTRIAL OPERATION AS CLASS 'C' OSCILLATOR

Anode supply from three-phase full wave rectifier without smoothing filter.

#### Absolute maximum ratings

f max.	30	Mc/s
V <sub>a</sub> max.	8.0	kV
-V <sub>g</sub> max.	1.6	kV
R <sub>g-f</sub> max.	10	kΩ
p <sub>a</sub> max.	15	kW
I <sub>a</sub> max.	4.0	A
I <sub>g</sub> max.	1.5	A
p <sub>g</sub> max.	800	W

#### Typical operating conditions

f	30	30	Mc/s
V <sub>a</sub>	7.0	6.0	kV
I <sub>a</sub>	3.5	3.3	A
I <sub>g</sub>	950	800	mA
p <sub>a</sub>	6.8	5.5	kW
η <sub>a</sub>	72	72	%
R <sub>g-f</sub>	0.95	1.0	kΩ
R <sub>a</sub>	1.0	0.87	kΩ
Feedback ratio $\frac{v_{in}(pk)}{v_a (pk)}$	0.25	0.26	
P <sub>out</sub>	17.7	14.3	kW
*P <sub>load</sub>	14	11	kW

\*0.85 (P<sub>out</sub>-P<sub>drive</sub>)

#### FILAMENT

Directly heated, thoriated tungsten

Vf	6.3	V
*If	130	A
rf (cold)	0.005	Ω

\*The filament current must never exceed a surge value of 280A at any time during the warming-up period. The filament has been designed to accept temporary variations in supply voltage of +5% and -10%.

#### CAPACITANCES

ca-g	33.5	pF
cg-f	44.5	pF
ca-f	1.2	pF

#### CHARACTERISTICS

(Measured at Va = 6kV, Ia = 2.5A)

gm	23	mA/V
μ	17.5	

(Measured at Va = 500V, Ia = 14A)

gm	28	mA/V
----	----	------

#### MOUNTING POSITION

Vertical, anode down

#### COOLING

Water cooled

Tseals max.	220	°C
-------------	-----	----

The amount of water cooling required for this valve depends on the anode dissipation and the temperature of the water. Typical values of rate of flow of water through helix and pressure loss in the helix are given in the curve on page C5. The minimum rate of flow of water through helix required can be found from the curves on page C6.

WATER THROUGH HELIX FOR INLET TEMPERATURES OF 20 AND 50°C

## TRIODE

Application: R.F. industrial heating.  
Power output: 14kW continuous rating.  
Frequency: 30Mc/s at full ratings.  
Construction: External anode, water cooled.

# TY8-15W

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS—TRANSMITTING VALVES, which precede this section of the handbook.

### FILAMENT Directly heated, thoriated tungsten

$V_f$	6.3	V
* $I_f$	130	A

\*The filament current must never exceed a surge value of 280A at any time during the warming up period. The filament has been designed to accept temporary fluctuations of  $+5\%$   $-10\%$

### MOUNTING POSITION

Vertical, anode down

### CAPACITANCES

$C_{a-g}$	33.5	pF
$C_{g-f}$	44.5	pF
$C_{a-f}$	1.2	pF

### CHARACTERISTICS (measured at $V_a = 6kV$ , $I_a = 2.5A$ )

$g_m$	23	mA/V
$g_m$ (at $V_a = 500V$ , $I_a = 14A$ )	28	mA/V
$\mu$	17.5	

### COOLING

Water cooled

Max. temperature of seals 220 °C

The amount of water cooling required for this valve depends upon the anode dissipation and the temperature of the water. Typical values of rate of water flow and pressure loss in the jacket are given in the following table:

Anode dissipation $P_a$ (kw)	Inlet temperature $T_{in}$ (°C)	Minimum rate of water flow per minute (litres) 4.5	Pressure loss in jacket (atm)
5.0	20	1.0	0.03
5.0	50	2.6	0.2
10	20	9.5	0.15
10	50	22	0.6
15	20	15	0.3
15	50	34	1.4

At inlet temperatures between 20 and 50°C the required quantity of water can be found by linear interpolation.

# TY12-20A

## R.F. POWER TRIODE

# TY12-20W

### TY12-20W

Water cooling			
T <sub>seals</sub> max.	220	°C	
T <sub>inlet</sub> max.	50	°C	

Typical values of inlet temperature, rate of flow of water, and pressure difference between the inlet and outlet housing at various anode dissipations are given below.

Anode dissipation Pa (kW)	Inlet temperature T <sub>in</sub> (°C)	Rate of flow of water per minute (litres) (gal)	Pressure difference between inlet and outlet (atm)
5.0	20	6.0	0.02
5.0	50	15	0.22
10	20	11	0.1
10	50	25	0.7
15	20	16	0.25
15	50	37	1.3
20	20	22	0.5
20	50	49	2.3

At inlet temperatures between 20 and 50°C the required quantity of water can be found by linear interpolation. In order to keep within the temperature limits it is necessary to direct a flow of air on to the seals. The air flow should be started at the application of filament voltage.

CATHODE

Directly heated, thoriated tungsten.

V <sub>f</sub>	17.5	V
*I <sub>f</sub>	196	A
r <sub>f</sub> (cold)	0.012	Ω

\*The filament current must never exceed a peak value of 420A at any time during the initial energising schedule.

The total filament current is shared between three terminals and it is important to ensure that the connections to these terminals and to the supply busbars are securely made and have negligible contact resistance. The filament limbs are internally connected in parallel and a faulty external connection could cause a high current in the other terminals leading to excessive heating of the glass seals.

When connecting the filament the three pins of each group must be joined.

**TY12-50H**

### ) COOLING

#### TY12-50A

Forced-air cooled

Maximum seals temperature 180 °C

The amount of forced-air cooling required for this valve depends upon the anode dissipation and the height above sea level. Typical values of inlet temperature, rate of flow of air and pressure difference between the inlet and outlet of the housing are given in the following table:

Anode dissipation (kW)	Height above sea level (m)	Maximum inlet temperature (°C)	Minimum rate of air flow (ft³ per minute)	Pressure difference between inlet and outlet (mm H₂O)	(in H₂O)
30	0	35	1236 35	114	4.49
30	0	45	1412 40	143	5.63
30	1500	35	1483 42	136	5.39
30	3000	25	1554 44	132	5.20
45	0	35	1907 54	275	10.83
45	0	45	2207 62.5	335	13.19
45	1500	35	2278 64.5	322	12.68
45	3000	25	2401 68	319	12.56

When operated at frequencies above 6Mc/s, special attention must be given to the temperatures of the anode and grid seals. They are cooled by air flowing through the slots provided at the top of the cooler housing. In certain cases, particularly at low anode dissipations and when cooling with the minimum quantity of air, the flow of air to the seals will not be sufficient to maintain the seal temperatures below the maximum permitted value at frequencies above 6Mc/s. In these cases, a larger quantity of air must be supplied.

When using the special filament connectors, together with connecting leads of adequate cross-section, it is not, as a rule, necessary to provide additional air cooling of the filament terminals. In order to ensure uniform distribution of current, care must be taken to ensure firm contact with the filament terminals.

TY12-50W and TY12-50H

Water cooled anode, low velocity air flow on seals.

Maximum temperatures

Seals	180	°C
Water inlet	50	°C

The amount of water cooling required for these valves depends upon the anode dissipation and the temperature of the water. Typical values of rate of flow of water and pressure loss are given in the following table:

Anode dissipation (kW)	Maximum inlet temperature (°C)	*Minimum rate of flow of water (l/min)	(gal/min)	Pressure loss (atm)
30	20	25	5.5	0.15
30	50	45	9.9	0.45
50	20	32	7.0	0.25
50	50	65	14.3	0.85
100	20	55	12.1	0.6
100	50	120	26.4	3.0

\*Rate of flow of water for temperatures between 20 and 50°C can be determined by linear interpolation.

In order to ensure that the maximum seals temperature (180°C) is not exceeded it may be necessary to direct a flow of air on to the seals. This flow of air must commence on or before the application of the filament voltage.

Anode and grid seals may be cooled by connecting a blower of suitable size to the air inlet of the anti-corona ring attached to the valve. At frequencies below 6Mc/s, air cooling will not normally be necessary. Above 6Mc/s air cooling must be used in order to prevent overheating of the anode and grid seals. At the maximum frequency (30Mc/s) and the published operating conditions at least 2.5m<sup>3</sup>(90ft<sup>3</sup>) per minute is required with a pressure loss of about 500mm (20in) of water.

When using the special filament connectors together with connecting leads of adequate cross-section it is not, as a rule, necessary to provide additional air cooling of the filament terminals. In order to ensure uniform distribution of current, care should be taken to ensure firm contact with the filament terminals.

### QUICK REFERENCE DATA

External anode triode, ceramic-metal construction, intended for use as class 'C' industrial oscillator.

The YD1160 is forced-air cooled.

The YD1161 is water cooled by means of a separate jacket.

The YD1162 has an integral helical water cooler.

f	27.12	150	MHz

### COOLING

YD1170

Anode - Forced-air cooled

Seals - At the higher values of anode dissipation and at the highest operating frequencies additional cooling is required.

#### Temperatures

All seals max.	200	°C
Envelope max.	200	°C
Air inlet max.	45	°C

Anode dissipation (kW)	Height above sea level (km)	Inlet temperature (°C)	Outlet temperature (°C)	Rate of air flow (m³/min) (ft³/min)	Pressure difference between inlet and outlet (mm H₂O)
10	0	35	94	9.5 335	55
8.0	0	35	105	6.5 229	28
6.0	0	35	113	4.5 159	15
4.0	0	35	117	3.0 106	8.0
10	0	45	98	11.0 388	69
8.0	0	45	108	7.6 265	35
6.0	0	45	115	5.2 184	19
4.0	0	45	119	3.5 123	10
10	1.5	35	94	11.4 405	63
8.0	1.5	35	105	7.8 273	32
6.0	1.5	35	113	5.4 194	17
4.0	1.5	35	117	3.6 131	9.0
10	3.0	25	90	12 424	62
8.0	3.0	25	102	8.2 291	32
6.0	3.0	25	111	5.7 203	17
4.0	3.0	25	116	3.8 138	9.0

**YD1171**

Anode - Water cooled (separate water jacket)

Seals - For frequencies >4 MHz air cooling is required.

Temperatures

All seals max.	200	°C
Envelope max.	200	°C
Water inlet max.	50	°C

Anode dissipation (kW)	Inlet temperature (°C)	Outlet temperature (°C)	Rate of water flow (litres) (gal)	Pressure difference between inlet and outlet (atm)
10	20	36	10	2.2
8.0	20	37	7.8	1.72
6.0	20	38	5.7	1.25
10	50	61	15	3.3
8.0	50	62	11.3	2.49
6.0	50	62	8.2	1.80

For inlet temperatures between 20 and 50°C the required water flow can be found by linear interpolation.

**YD1172**

Anode - Water cooled (integral cooler)

Seals - For frequencies >4 MHz air cooling is required.

Temperatures

All seals max.	200	°C
Envelope max.	200	°C
Water inlet max.	50	°C

Anode dissipation (kW)	Inlet temperature (°C)	Outlet temperature (°C)	Rate of water flow (litres) (gal)	Pressure difference between inlet and outlet (atm)
10	20	46	6.0	1.32
8.0	20	49	4.5	0.99
6.0	20	53	3.0	0.66
10	50	67	9.0	1.98
8.0	50	69	6.7	1.47
6.0	50	72	4.5	0.99

For inlet temperatures between 20 and 50°C the required water flow can be found by linear interpolation.

MOUNTING POSITION

Vertical, anode up or down

With anode uppermost inlet and outlet water connections should be reversed. ←

## R.F. INDUSTRIAL TRIODE

**YD1212**

### COOLING

Anode - water cooled with integral cooler

Seals - low velocity air flow or water cooled connectors

#### Temperatures

All seals absolute max.	240	°C ←
Water inlet max.	50	°C

### WATER COOLING CHARACTERISTICS

*Anode Dissipation (kW)	Inlet Temperature (°C)	Rate of flow (l/min)	Inlet Pressure (atm)	Outlet Temperature (°C)	←
120	20	60	0.7	49	
120	50	90	1.3	69	
80	20	34	0.3	54	
80	50	54	0.55	72	
40	20	15	0.07	59	
40	50	24	0.13	75	

Cooling the seals can be accomplished by low velocity air flow or water cooling of the filament connectors. In the latter case care should be taken to have proper electrical insulation between the filament connectors and the grid connector. The cooling circuits of the filament connectors may be connected in series. A water flow of approximately 0.5 litre/min will be sufficient.

\*A large part of the filament power and grid power is radiated to the anode and increases the temperature of the anode cooling water accordingly.

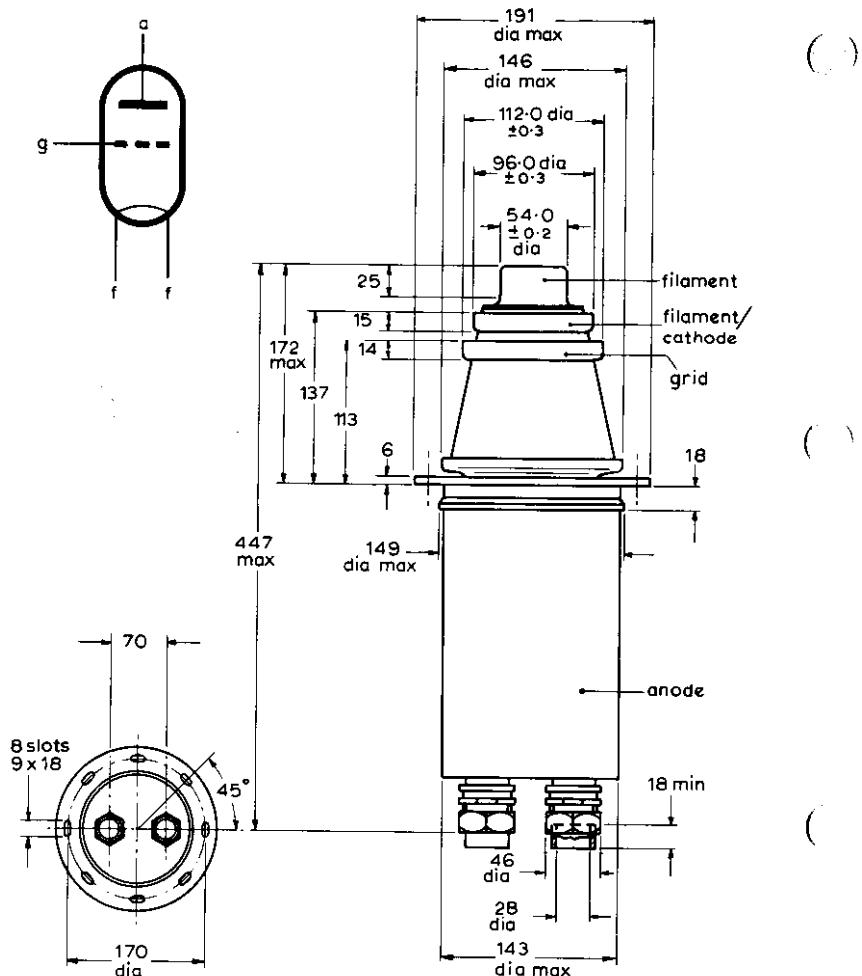

### ACCESSORIES

Grid connector, f<4.0MHz	40694
f>4.0MHz	40737 ←
Filament connectors (both types required)	40695 and 40696
Filament cables (both types required)	40716 and 40717 ←

### CLASS 'C' OPERATION F.M. TELEPHONY

#### Maximum recommended operating conditions

These conditions are based on reaching either the maximum electrode ratings or the point where load efficiency ( $\eta_{load}$ ) begins to fall rapidly. The conditions for 175Mc/s were measured in a circuit with a parallel tuned output circuit. If a series tuned output circuit is used at this frequency with the same operating conditions, approx. 10% higher  $P_{load}$  figures are obtained.

**QUICK HEATING  
DOUBLE TETRODE**

**YLI020  
QQZ03-20**

**Typical operating conditions**

$f_{out}$	200	460	Mc/s
$V_a$	300	300	V
$V_{g2}$	250	250	V
$-V_{g1}$	175	175	V
$V_{in(pk)}$	$2 \times 205$	$2 \times 285$	V
$I_a$	$2 \times 45$	$2 \times 45$	mA
$I_{g2}$	$2 \times 4.0$	$2 \times 3.5$	mA
$I_{g1}$	$2 \times 3.0$	$2 \times 2.5$	mA
$P_{load}$ (driver)	3.0	5.0	W
$\eta_a$	33	26	%
$P_a$	$2 \times 9.0$	$2 \times 10$	W
$P_{out}$	9.0	7.0	W
$P_{load}$	7.0	5.5	W

**OPERATING NOTE**

$I_{g1}$  and  $I_{g2}$  will vary from valve to valve, hence the use of fixed resistors  $R_{g1}$  and  $R_{g2}$  will result in variation of input and output power. It is therefore recommended that  $R_{g2}$  be made adjustable.

**CATHODE**

Quick heating directly heated filament. 70%  $P_{out}$  in less than 0.5 second. ←

## V.H.F. DOUBLE TETRODE

**YL1060**

### CATHODE

Indirectly heated, oxide coated

	Parallel	Series	
$V_h$	6.3	12.6	V
$I_h$	1.8	0.9	A

### CAPACITANCES

$c_{a-g1}$ (each section)	max 90	pF
$c_{out}$ (two sections in push-pull)	3.2	pF
$c_{in}$ (two sections in push-pull)	10.5	pF

Internally neutralised for push-pull operation

### CHARACTERISTICS (measured at $I_a = 30mA$ )

$g_m$	4.5	mA/V
$\mu_{g1-g2}$	8.2	

### MOUNTING POSITION

Vertical with base up or down.

Horizontal with the anode pins in a horizontal plane.

### COOLING

Radiation and low velocity air flow

### MAXIMUM TEMPERATURES

Anode seal	250	°C
Bulb	250	°C
Base	180	°C

When the valve is operated at maximum ratings or with high ambient temperatures it may be necessary to direct an air flow on the bulb and anode seals.

### PHYSICAL DATA

Weight of valve only	2.5	g

Ig1	2 x 1.0	2 x 1.0	2 x 1.6	mA
vin(g1-g1)pk	230	230	230	V
pa	2 x 4.7	2 x 4.25	2 x 4.0	W
pg2	2 x 0.15	2 x 0.16	2 x 0.23	W
Pload (driver)	1.0	1.0	2.0	W
Pout	5	4	3.5	W
Pload	3.5	3.0	2.8	W
$\eta_a$	35	34	31	%

### OPERATING NOTE

Ig1 and Ig2 will vary from valve to valve, hence the use of fixed resistors (Rg1 and Rg2) will result in variations of input and output power. It is therefore recommended that Rg2 be made adjustable.

### CATHODE

Directly heated, harp type, 70 % Pout in less than 0.5 second.

Vf (d.c. or r.m.s.)	1.6	V
If	2.5	A

### Frequency of filament supply

Sine wave	max. 200	c/s
Square wave	Any	

### CAPACITANCES

Internally neutralised for push-pull operation.

ca-g1 (each section)	100	mpF
cout (each section)	3.2	pF
cin (each section)	8.5	pF
ca"-g1'	100	mpF
ca"-g1"	100	mpF
cg1'-g1"	2.4	pF
ca'-a"	75	mpF

### CHARACTERISTICS (measured at Va = 200V, Vg2 = 200V, Ia = 30mA)

gm	3.5	mA/V
$\mu g1-g2$	7.5	

**COOLING**

### TELEGRAPHY OR F.M. TELEPHONY, CLASS 'C'

OPERATING CONDITIONS for valve in common grid circuit.

f	790	470	Mc/s
$\dagger P_{out}$	590 + 30	765 + 25	W
$P_{load}$	590	730	W
$\eta_a$	47	61	%
$V_{a-g1}$	2.5	2.5	kV
$I_a$	500	500	mA
$V_{g2-g1}$	400	400	V
$I_{g2}$	7.0	8.0	mA
$V_{k-g1}$	45	35	V
$I_{g1}$	10	12	mA
$P_{load(driver)}$	60	35	W
$p_a$	660	485	W

$\dagger$ Includes power transferred from driver stage.

### LINEAR AMPLIFIER FOR TELEVISION TRANSLATOR SERVICE, CLASS 'A'

Sound and vision.

OPERATING CONDITIONS

Bandwidth (-1dB)	> 6.5	Mc/s
$P_{load}$	55	W
*Intermodulation products	-51	dB
$V_a$	1.4	kV
$V_{g2}$	0.4	kV
$-V_{g1}$	30	V
$I_a$	400	mA
$I_{g2}$	-10	mA
$P_{load(driver)}$	5.0	W

$\ddagger$ The intermodulation product in the passband of the output signal is measured with reference to peak envelope output.

**TELEPHONY, ANODE AND SCREEN GRID MODULATION, CLASS 'C'**

OPERATING CONDITIONS (cathode drive)

$f$	400	Mc/s
$\dagger P_{out}$	640	W
$P_{load}$	600	W
$\eta_a$	64	%
$V_a$	2.0	kV
$I_a$	500	mA
$V_{g2}$	400	V
$I_{g2}$	8.0	mA
$-V_{g1}$	35	V
$I_{g1}$	12	mA
$P_{load(driver)}$	35	W
$p_a$	360	W
$p_{g2}$	3.2	W
For 100% modulation		
$P_{mod}$	502	W

$\dagger$ Includes power transferred from driver stage.

RATINGS (ABSOLUTE MAXIMUM SYSTEM)

	Telephony Class 'C'	Telegraphy Class 'C'	TV Class 'A'	S.S.B. Class 'B'	
$V_a$ max.	2.0	2.5	2.5	2.5	kV
$V_{g2}$ max.	1.2	1.2	1.2	1.2	kV
$-V_{g1}$ max.	250	250	250	250	V
$I_a$ max.	500	500	500	500	mA
$p_a$ max.	400	700	600	600	W
$p_{g2}$ max.	17	25	25	25	W
$I_{g1}$ max.	100	100	100	100	mA
$R_{g1-k}$ max.	15	15	15	15	kΩ

CATHODE

Indirectly heated, oxide coated, matrix type.

$V_h$	6.3	V
$I_h$	7.85	A
$t_{h-k}$ min.	120	s

The heater has been designed to accept temporary fluctuations of supply voltage of  $\pm 10\%$ .

The heater voltage must be reduced depending on operating conditions and frequency.

## U.H.F. BEAM POWER TETRODE

YL1110

### CAPACITANCES

<sup>c</sup> a-g1	<0.11	pF	←
<sup>c</sup> g1-k+h	29	pF	
<sup>c</sup> a-k+h	<0.011	pF	
<sup>c</sup> g1-g2	37	pF	
<sup>c</sup> g2-k+h	<1.1	pF	

### CHARACTERISTICS

$\mu_{g1-g2}$ (measured at $V_a = V_{g2} = 225V$ , $I_a = 100mA$ )	13		
$g_m$ (measured at $V_a = 2.5kV$ , $V_{g2} = 400V$ , $I_a = 240mA$ )	22	mA/V	

### MOUNTING POSITION

Any

### COOLING

Forced-air cooling will be required for the radiator and ceramic to metal seals.

Maximum temperature of anode and all seals                    250                    °C

The amount of forced-air cooling of the anode at an air inlet temperature of 25°C is given in the table below:-

Anode dissipation (W)	Minimum rate of air flow (m <sup>3</sup> /min)	Pressure (mm water)	
100	0.06	2.12	2.0
300	0.12	4.24	4.0
600	0.32	11.30	17
700	0.46	16.25	25

A low velocity air flow is required for all other electrodes and seals.                    ←

## OPERATING NOTES

### 1. SAFETY PRECAUTIONS

The following precautions must be adopted when dealing with the Beryllia insulator used when coupling the anode to its heatsink.

The block is entirely safe provided its component parts or finish are not tampered with. The dust of Beryllia is toxic. Care should be taken to ensure all those who may handle, use or dispose of the block are aware of its nature and the necessary safety precautions applicable to Beryllia. In particular, it should never be disposed of with general, industrial or domestic waste.

### Disposal Service

Formed Beryllia or devices incorporating Beryllia requiring disposal may be returned to Mullard Service Department. They must be separately and securely packed and clearly identified. If the block or device is damaged or broken IT MUST NOT be sent through the post. In such a case advice is available from the Service Department.

## 2. CONSIDERATIONS OF ANODE COOLING

The Beryllia block and thermal compounds, used to reduce the heat resistance between the anode and heatsink, are referred to as the thermal system. The anode dissipation rating is applied over the entire thermal system, the thermal resistance of which may be found by the equation:-

$$K_{\max} = \frac{T_s \text{ max } (^\circ\text{C}) - T_{\text{amb}} (^\circ\text{C})}{P_d (\text{Watts})}$$

Where  $T_s$  max. = Maximum seal temperature

$T_{\text{amb}}$  = Ambient temperature

$P_d$  = Power to be dissipated

$K$  = Total thermal resistance from seal to ambient

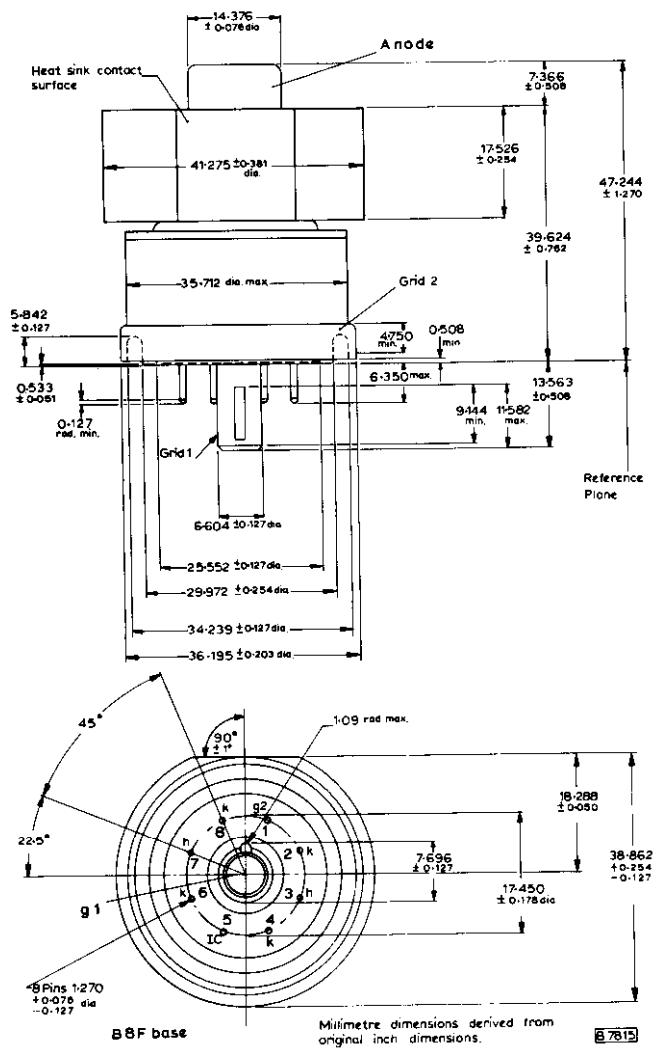

Page C1 gives a plot of this equation.

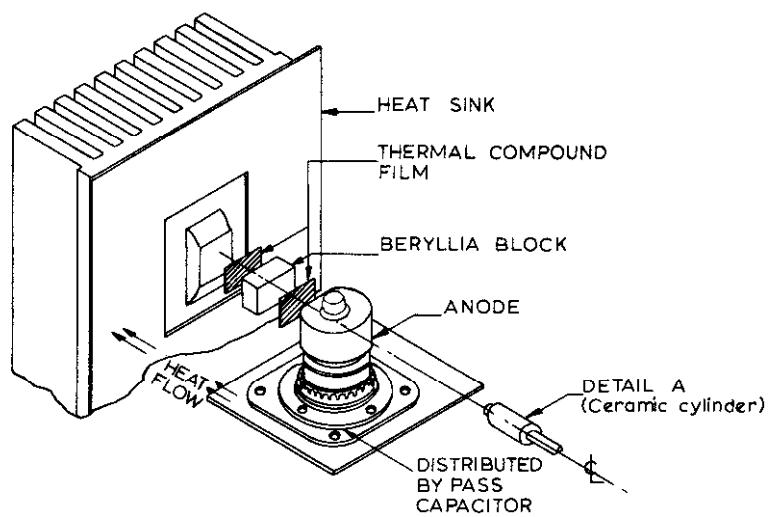

In order to assure a good thermal contact with the heatsink, it is necessary to apply a force of approximately 11.5kg to the side of the valve opposite the heatsink. See Detail A page D6.

P <sub>load</sub> sync	6.25	kW
black	3.75 <sup>c</sup>	kW
P <sub>load (driver)</sub> sync	285	W
Gain	22 <sup>b</sup>	
R <sub>a</sub>	800 <sup>b</sup>	$\Omega$
Sync compression	28/25 <sup>d</sup>	
Differential phase	$\leq 3.0^e$	deg
Differential gain	$\geq 80^e$	%

NOTES

a. To be adjusted for I<sub>a(0)</sub>.

b. With double tuned circuit.

c. Black signal including line sync pulses.

d. A picture/sync ratio of 75/25 for the outgoing signal requires a ratio of max. 70/30 for the incoming signal.

e. Measured with a sawtooth amplitude, running from 17% to 75% of the peak sync value, with superimposed a 4.43MHz sine wave with a 10% peak to peak value.

## RATINGS (ABSOLUTE MAXIMUM SYSTEM)

	Narrow Band Service Class 'B'	Television Service Class 'AB'	
f max.	≤250	≤250	MHz
V <sub>a</sub> max.	6.0	6.0	kV
V <sub>g2</sub> max.	1.0	1.0	kV
-V <sub>g1</sub> max.	500	500	V
I <sub>a</sub> max.	4.0	4.0	A
p <sub>a</sub> max.	6.0	6.0	kW
p <sub>g2</sub> max.	80	80	W
p <sub>g1</sub> max.	40	40	W
R <sub>g1-k</sub> max.	10	10	kΩ

## CATHODE

Directly heated. Thoriated tungsten.

*V <sub>f</sub>	6.3	V
I <sub>f</sub>	120	A
i <sub>f(pk)</sub> starting	500	A

\*The filament has been designed to accept temporary fluctuations of supply voltage of ±5%.

## CAPACITANCES

	Grounded cathode	Grounded grid	
c <sub>out</sub>	15.3	15.8	pF
c <sub>a-g1</sub>	0.48	-	pF
c <sub>a-f</sub>	-	0.16	pF
c <sub>in</sub>	90	48	pF

CHARACTERISTICS (Measured at V<sub>a</sub> = 5kV, V<sub>g2</sub> = 600V, I<sub>a</sub> = 1.45A)

g <sub>m</sub>	30	mA/V
μ <sub>g1-g2</sub>	7.5	

MOUNTING POSITION

Vertical, anode up or down

COOLING

Forced-air. See page 8.

Temperatures

Seal max.	200	°C
Envelope max.	240	°C
Air inlet max.	35	°C

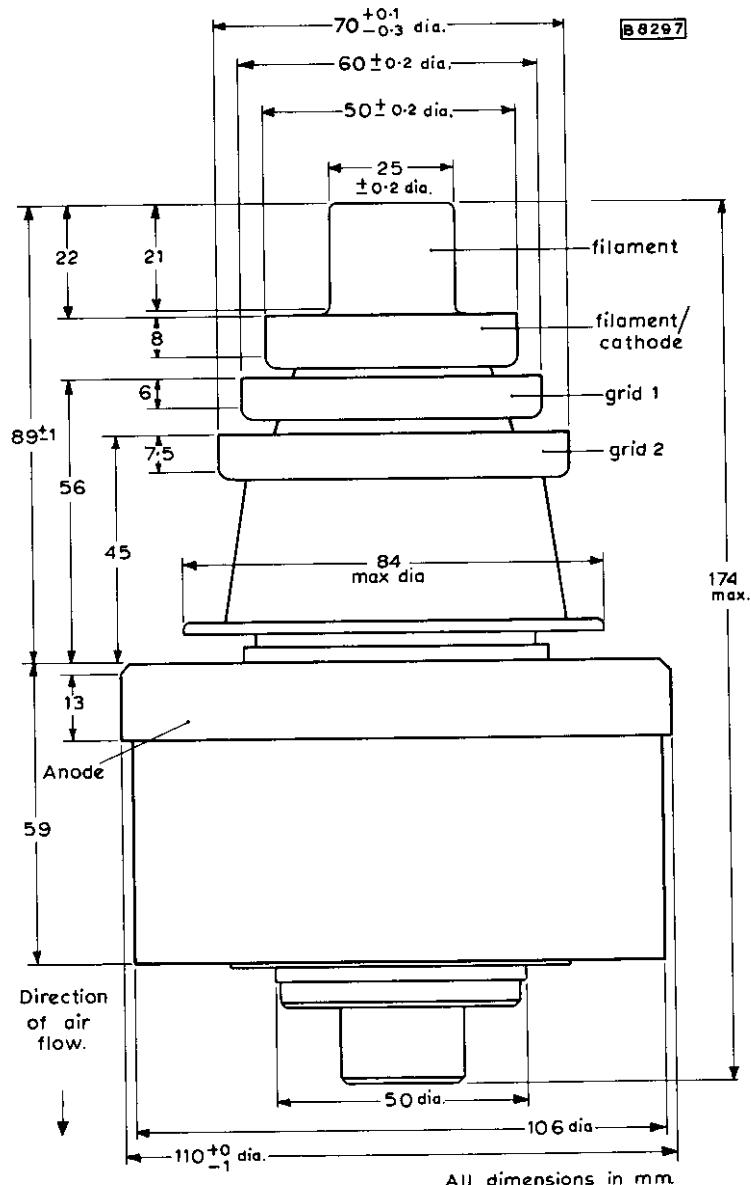

PHYSICAL DATA

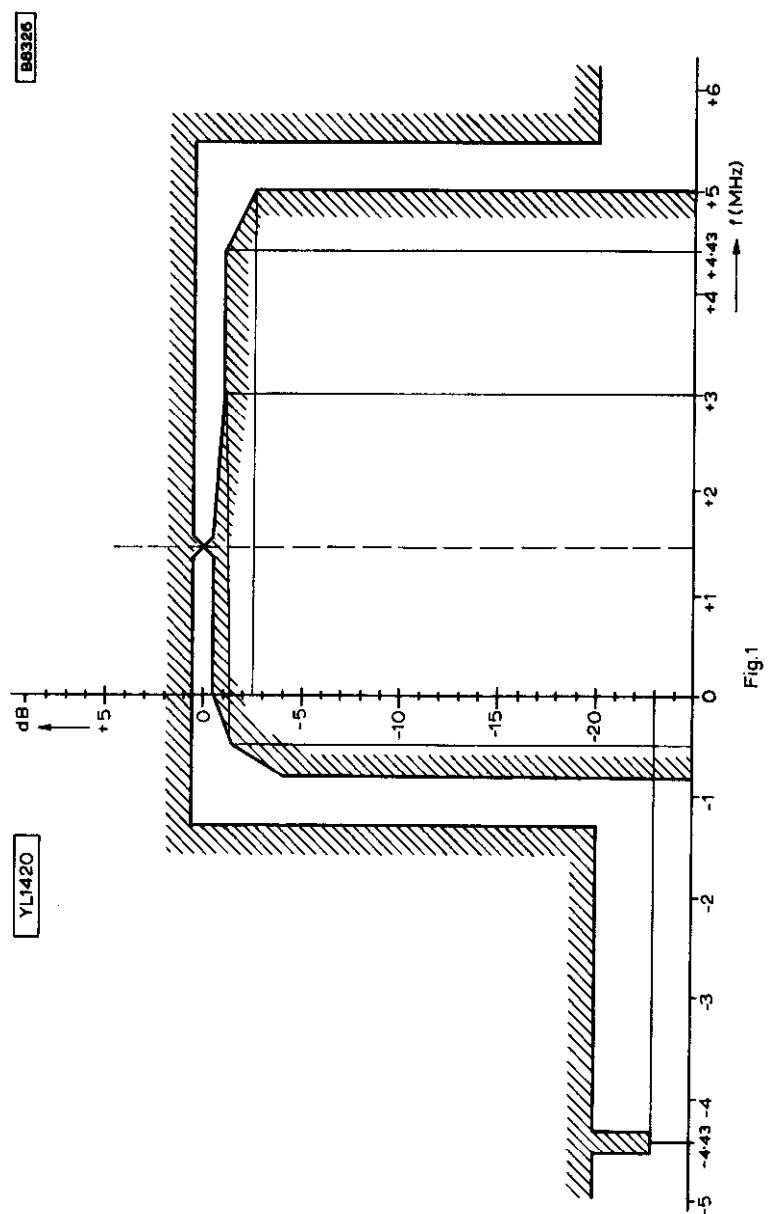

Weight of valve	2.8	kg
