COOLING

Sufficient air must be passed over the concentric base terminals and through the radiator fins to maintain the temperatures of the ceramic to metal seals and the radiator core below the maximum rated value of 250°C. It is recommended that an air distribution socket MA87 and chimney type MA104A be used with the tube (see pages 10, 11 and 12).

The air flows required with the recommended air socket and chimney to maintain the seal temperatures at 200°C in an ambient temperature of 50°C at sea level and with an operating frequency of less than 30MHz are given

below. At higher ambient temperatures, altitudes or frequencies the rate of flow must be adjusted to give equivalent cooling and should be determined individually in each case. An allowance of 1000 watts for the power dissipated by the filament and grids has been made in the values given.

NOTES

1. The valve must be operated at the stated filament voltage. Fluctuation in filament voltage must not exceed $\pm 5\%$.
2. Grid current does not flow during any part of the audio frequency cycle.
3. The grid voltage is adjusted to obtain the specified zero-signal anode current.
4. The peak envelope or r.f. output power at the crest of the modulation envelope.
5. This corresponds to 10kW anode dissipation at 100% sine wave modulation.
