

## TMA.406 (F8080)

# DOUBLE ENDED ELECTROMAGNETIC DEFLECTION SCAN CONVERTER STORAGE TUBE

The TMA.406 is a dual gun, electrical signal storage tube. The writing beam deposits, by induced conductivity, electron charges on a thin semi-conducting target. The recorded signals are read by the reading beam by use of secondary emission effects during a large and adjustable number of reading frames.

The TMA,406 scan converter tube allows:

- simultaneous writing and reading without crosstalk
- writing in a mode of scanning and reading in a different mode
- adjustment of the storage time
- fast erasure of the written signals
- superposition of several kinds of information.

The symetrical deflections and the absence of collimation of the TMA.406 make it free from geometrical distortion.

### TYPICAL APPLICATIONS

Air traffic control (conversion of P.P.I. radar scan to T.V. scan)

In radar bright display equipments this tube allows:

- display on a T.V. monitor of a bright, sharp picture in high ambient lighting conditions,
- visual target tracking by means of the tube storage characteristics,
- retransmission and multiple display of the radar picture.

Remote transmission of radar or T.V. informations over narrow bandwidth channels.

Signal to noise enhancement by integration.

Superposition of several types of input data.

#### TYPICAL PERFORMANCES

Output signal current	0. 8 μΑ		
Output capacitance	15 pF		
Resolution	180 P.P.I. range rings at 50 % modulation		
	(equivalent to approximately 1000 T.V. lines)		
Storage time with continuous read-out*	adjustable from 1 to 30 s		
	at 50 % residual		
Gray levels	7		
Fast erasing time, max.	5 s		

### **OPERATING CONDITIONS**

Unless otherwise stated, voltages are given with respect to ground.

## Absolute ratings

WRITING GUN - Electrostatic focusing, electromagnetic deflection.  Heater voltage (note 1)	0	6. 3 ± 10 % -9 ±150 to -100 0 to -9	V kV V V kV
READING GUN - Electrostatic focusing, electromagnetic deflection.  Heater voltage (note 2)  Cathode k voltage  Voltage between heater and cathode  Control grid g1 voltage (w. r. t. cathode)  Anode g2 voltage  Erasing g3 voltage  Focusing g4 voltage	0 0 0	6. 3 ± 10 %  -2  ±150  to -100  to -50  to -2. 5	V kV V V kV
Typical operation  WRITING GUN  Heater voltage Heater current, approx. Cathode k' voltage Voltage between heater and cathode Control grid g'1 voltage for cut-off (w.r.t. cathode) Anode g'2 voltage Focusing g'3 voltage	-30 -5	6. 3 0. 6 -8 0 to -90 to -6	V A kV V V V
READING GUN  Heater voltage Heater current, approx. Cathode k voltage Voltage between heater and cathode. Control grid g1 voltage for cut-off (w.r.t. cathode) Anode g2 voltage  Erasing g3 voltage  reading mode erasing mode  Focusing g4 voltage	-30 -10 -1. 5 -1. 1	6. 3 0. 6 -1. 5 0 to -90 to -30 0 to -1. 9 to -1. 4	V A kV V V V kV kV
STORAGE ASSEMBLY  Target voltage reading mode reasing mode  Collector voltage Shading corrector voltage Shading corrector voltage	+200 0 0	0 then-200 to 40 to 60	V V V

#### **NOTES**

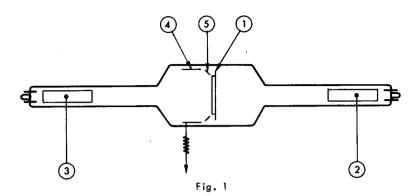

- 1 Heater insulated for 10 kV w.r.t. ground 2 Heater insulated for 3 kV w.r.t. ground

### **OPERATING RECOMMENDATIONS**

- 1 The writing beam should never be motionless on the storage surface which might be damaged. Too high writing beam current density must be avoided.
- 2 The reading beam should never be motionless.
- 3 Provide a suitable shield in order to protect the tube from stray electric and magnetic fields.

## PHYSICAL DESCRIPTION AND OPERATING PRINCIPLE

The TMA.406 essentially consists of (see fig. 1):

- a storage target (1) made of a dielectric layer deposited on a thin metallic backplate (the metallic side facing the writing gun)
- a writing gun (2)
- a reading gun (3)
- a collecting assembly made of two electrodes (4) and (5).

Due to its high velocity, the writing beam is able to penetrate the metal backplate and to create charges in the dielectric by induced conductivity (EBIC). These charges are stored on the surface of the target facing the reading gun. The quantity of stored charges depends on the scanning speed and current density.

The reading beam scanning the storage surface, each scan is removing a portion of the charge pattern by secondary electron emission.

The secondaries collected by the output electrode (4) give rise to a video signal progressively decreasing.

Typical decay curves given in fig. 2 are obtained by changing both collector voltage and/or reading current.

When fast erasure is required, tube should be operated as indicated in fig. 3.
