## ULTRARROGM RESOLTFOON CATMODE RAY TURES

## 2000 lines per inch resolution short persistence phosphor screen. . . . . . . used for photographic recording and UHR radar

The CBS-Hytron cathode ray tubes, primarily ultra-high resolution read out tubes or monitors, are designed for high precision display and photugraphic use. They are capable of resolving 2000 lines per inch. For a line sean of 4.5 inches in a 5 inch diameter tube, a total of 8000 lines can be achieved.

By the immersion electron optical design, the beat is controlled over its entire post-accelerarion path. Moreover the half-deflection angle of $9.5^{\circ}$ insures accurate deffection linearity with suitable yokes*. Defocusing at the edge of the usable sereen is less than $2.5 \%$, which is negligible. but may be corrected to near zero by simple dynamic focusing. It should be realized that sone loss of resolution will oceur ar the extrenes of deflecrion. This loss results from the geometry of a flar face plate and is held to Jess than $15 \%$.

Tubes are available with P 5 or P 11 phosphor. These CR tubes are particularly suitable for photographic recording since the peak wavelengths of the phosphor fall within the blue region of the spectrum (4300 $\mathrm{A}^{\circ}$ and $4600 \mathrm{~A}^{\circ}$ respectively).
Tubes are also available in P16 phosphor. Pio has a shorter persistence of 1 us permitring use of these tubes in flying spot scanner work.
These ultra high resolution cathode ray tubes open up whole new fields of application in strip radar, photo recomaissance, visual indication, photo reproduction, information transfer, industrial and medical closed-circuit TV, and remute data pick up.

* The magnetically shielded focus coil and deflection yokes, available from CBS-Hytron, have been designed far 1000 cps as well as the commercial TV scanning rate, are linear to within $\pm 2.5 \%$, and are made for 20 Kv anode voltage
