TYPE 7498: HIGH SLOPE R.F. PENTODE.

The 7498 is a seven pin all glass construction pentode for use in R.F. and I.F. applications.

The use of a special rugged electrode construction manufactured by means of semi-automatic assembly techniques contributes to a low catastrophic failure rate.

The cathode sleeve is made of a special alloy to inhibit the growth of cathode interface resistance during long periods of operation under cut-off conditions and the pure tungsten heater has been designed to withstand frequent heater switching (see note). In addition the heater-cathode construction and materials ensure very low levels of leakage throughout life.

The glass base and envelope strain patterns are tightly controlled during manufacture to prevent glass failures during life. Special attention is also given to the control of materials and processes to minimise variation of characteristics during life. A particular feature is the very low change in inter-electrode capacitances during life.

NOTE: A sample from each production lot is tested under the following elevated conditions to assess heater quality:- heater voltage 120% of nominal value; heater-cathode voltage 240V r.m.s.; applied voltages cycled 1 minute on, 3 minutes off for 100 hours.
