## THYRATRON TYPE WL-7509

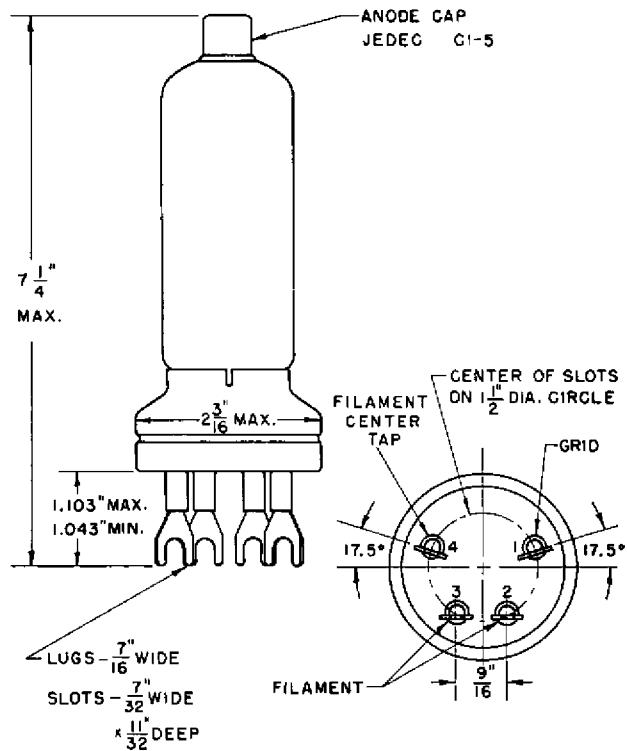

The WL-7509 is a three-electrode thyratron with negative control characteristic and an inert gas-mercury vapor filling. The WL-7509 has the long life characteristic of mercury vapor tubes and the fast starting and wide ambient temperature range associated with inert gas tubes. It is designed for ignitor firing and industrial control applications. The WL-7509 is electrically similar to the WL-7307.

### ELECTRICAL:

Filament:	Min.	Bogey	Max.	
Voltage	2.37	2.50	2.63	Volts
Current	--	9.0	11.0	Ampères
Heating Time	20	--	--	Seconds
Direct Interelectrode Capacitances:				
Anode to Grid			2 $\mu\text{f}$	
Grid to Filament			12 $\mu\text{f}$	
Critical Grid Voltage			See Critical Grid Voltage	
Deionization Time (Typical)			1000 $\mu\text{seconds}$	
Ionization Time (Approx.)			10 $\mu\text{second}$	
Anode Voltage Drop (Typical with 8 Ampères Peak)			10 Volts	

### MECHANICAL:

Type of Cooling	.....	Air, Unrestricted Convection
Mounting Position	.....	Vertical, Base Down
Bulb	.....	T-12
Base	.....	Lug Location and Size per JEDEC A4-90
Net Weight	.....	4 Ounces
Shipping Weight (Approx.)	.....	24 Ounces

### MAXIMUM RATINGS

Absolute Maximum Values		
Peak Anode Voltage:		
Forward	1500	max. Volts
Inverse	1500	max. Volts
Cathode Current:		
Peak	30	max. Ampères
Average	2.5	max. Ampères
Averaging Time	5	max. Seconds
Fault (Surge, Max. Duration 0.1 Sec.):▲		
Connection (a) See CE-A1103, . . . . .	240	max. Ampères
Connection (b) See CE-A1103, . . . . .	120	max. Ampères
Connection (c) See CE-A1103, . . . . .	120	max. Ampères
Negative Grid Voltage:		
Before Conduction	250	max. Volts
During Conduction	10	max. Volts
Positive Grid Current (Average):◆		
Averaging Time = 1 Cycle	0.10	max. Ampere
Maximum Frequency■	150	max. CPS
Condensed Mercury Temperature		
Range◆	-40 to +80	max. °C

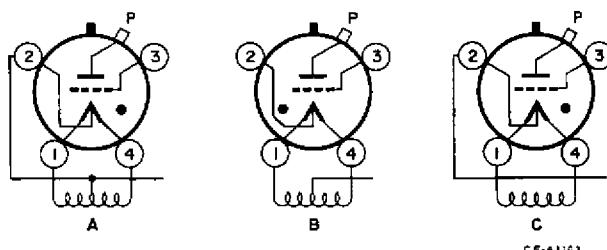

▲ These ratings are effective only anode return connections are made as shown in CE-A1103.

◆ This rating indicates the heat emission properties of the grid. This value of current may be safely drawn to the grid if conduction occurs only while the anode is positive. However, during the period of negative anode potential, the grid potential must also be negative to prevent electrons being drawn to the grid and generating positive ions which would bombard the anode.

■ Satisfactory starting and operation will result at the condensed-mercury temperature indicated. For optimum life, the condensed-mercury temperature after warm-up should be 40 to 80 °C. If the tube is operated at condensed-mercury below 20 °C for extended periods, the usual circuit precautions for inert gas tubes should

■ For higher frequency ratings, consult the tube manufacturer.
